holds the edge

## DELAYED ACTION DOOR HOLDER

**Doordwell, the simple and easy solution for all self-closing doors.**

**Doordwell is a cost-effective air-bleed sucker device which will hold any type of spring or pneumatically self-closing door open for an adjustable period of time between ten seconds and one minute.**

Doordwell provides an alternative to expensive door holding devices such as Electro-Magnetically Held Open Doors and can be retrofitted into existing buildings. Fire Prevention Officers actively recommend Doordwell as a simple and effective solution for doors that are constantly being propped open illegally.

Doordwell holds the edge because it is totally fail safe. There are no mechanical parts to wear out, giving Doordwell an extended life span in every building which requires fire safety and energy economy, where doors must be closed after use. Thousands of these devices are working reliably today and every day.

*"In our opinion Doordwell may be fitted to any fire resisting and smoke door set without compromising the doors ability to self close, its fire resistance and its durability."*

- K. Trotter (Consulting Fire Scientist)

### Applications

Doordwell has many applications and can quickly and easily be installed into all buildings which require fire safety, energy and air conditioning control through the use of self closing doors. Some examples include:

- **Hospitals and Nursing Homes** Patients in beds and wheel chairs as well as food and medicine trolleys require rapid movement where self closing doors need to stay open for short periods of time.
- **Hotels, and Serviced Apartments** Trolleys and guests luggage need to be moved quickly in and out of areas with fire doors.
- **Schools, Warehouses and Training Institutions** Avoiding damage from kicks and bumps when students and large volumes move back and forth through self closing doors.

### Installation and adjustment

Doordwell is strong and reliable. The sucker face is only seventy five millimetres in diameter and is attached to a robust powder coated steel bracket which can be installed either at floor level, or wall mounted. A corresponding polycarbonate pad attaches to the door which the sucker face holds onto for a limited time whenever the door has been fully opened.

Doordwell is also simple to install and to adjust. A couple of screws and Doordwell is up and running! To adjust the suction, simply turn the screw in the centre of the suction pad to lengthen or decrease the time required for Doordwell to hold the self closing door open.

### Additional benefits

As well as a fail safe door delay device, Doordwell has the added advantage of being an excellent doorstop, reducing wear and tear on doors and the need to resort to using illegal and dangerous door wedges and hooks.

***For economy, durability and performance, Doordwell holds the edge***
